Summary

Staff software engineer with 13+ years of experience designing and operating high-scale distributed systems across platform infrastructure, real-time messaging, and payments. Currently owns Tier-0 platform services and a foundational shared library powering 75+ microservices at Salesforce, with a focus on scalability (100K concurrent conversations), reliability (99.95% uptime), and developer experience. Proven track record of delivering measurable impact â€” 35x throughput improvement on event processing, 30% latency reduction at eBayâ€™s 200M+ calls/day checkout platform, and cross-border payment systems at Bill.com. Combines deep backend expertise in Java/Spring Boot, Kafka, gRPC, and Kubernetes with a bias toward ownership, observability, and shipping safely at scale.

Experience

Salesforce, San Francisco

Lead Member of Technical Staff â€” Platform Engineering December 2023 â€” Present

- Own and operate 3 Tier-0 and 2 Tier-1 platform services powering the real-time conversation platform â€” including a durable key-value store, an SSE-based event routing service, and a singleton key-distribution service â€” deployed on Kubernetes.
- Maintain a core shared library (app starter) adopted by 75+ services across the service stack, serving as the foundational dependency for the organizationâ€™s microservice ecosystem.
- Enhanced the Event Bus Starter library with bi-directional streaming and batch event processing, reducing latency from ~7s to ~200ms and increasing throughput from 20 to 1,000 events/sec.
- Led Spring Boot 3.4 / JDK 17 upgrade across platform services and shared libraries, achieving security compliance and unblocking 75+ downstream services from modernizing their stack.
- Drove migration of all platform services to Helm add-on and Argo Rollout, enabling canary deployments that reduced blast radius for production releases; now advising other teams on safe adoption.
- Architected bucket-snapshot handoff mechanism for the persistence layer, enabling seamless state transfers during restarts and rebalancing to support 100K concurrent conversations.
- Built automated Grafana dashboards integrated with SLO exporters, enabling self-service onboarding for new services and improving pager-duty investigation and resolution times.
- Resolved critical GovCloud deployment blockers (BouncyCastle/OpenSAML incompatibilities) and patched time-sensitive 3PP vulnerabilities across production services.
- Led production buildouts, moratorium exit criteria, and incremental rollout configuration with performance testing for safe, phased deployments.

Lead Member of Technical Staff â€” Messaging November 2021 â€” March 2023

- Architected and built gRPC microservices for the conversation messaging platform â€” Send Message, Transfer, Conference, Typing Indicators, Read/Delivery Receipts â€” on a distributed, multi-tier system using Kafka, gRPC, and SSE.
- Delivered full-stack real-time messaging UI in the Salesforce Lightning framework, achieving sub-millisecond push communications.
- Developed an availability framework for front-end and back-end services, maintaining 99.95% uptime across component features.
- Built and maintained 90% code coverage through unit, functional, integration, and disruptive testing.

Bill.com, San Jose

Staff Software Engineer March 2023 â€” December 2023

- Led cross-functional delivery of Bank Search and FX Payment Processing features, driving international payments expansion for the platform.
- Designed and built well-documented APIs for international payment workflows, serving both internal teams and external integrators.
- Implemented comprehensive monitoring and alerting on Splunk and Datadog, enabling proactive detection of performance degradation and critical incidents.

eBay, San Jose

Software Engineer March 2018 â€” November 2021

- Developed and scaled the checkout platform handling 200M+ API calls/day, 10M+ checkouts/day, and 36 client integrations.
- Integrated external payment providers (Adyen, PayPal, Klarna, Apple Pay, Google Pay, Afterpay) into the checkout pipeline.
- Spearheaded cache integration that reduced response time by 30% and database load by 20% â€” awarded Spot Award for initiative.
- Built automated deployment pipelines (ECD) improving continuous integration practices across the team.

Infosys, Pune, India

Sr. Associate Consultant January 2015 – August 2016

- Designed and developed Java web applications; owned testing cycle with automation tooling.

ING / ICICI Bank, Mumbai

System Analyst April 2011 – January 2015

- Business and systems analysis: requirements modeling, process mapping, UAT administration.

Skills

Languages & Frameworks: Java, Spring Boot, J2EE, JavaScript, Angular, HTML/CSS, PHP, Node.js

Data & Messaging: Kafka, MySQL, MongoDB, Cassandra, Oracle SQL

APIs & Protocols: gRPC, REST, SOAP, SSE

Infrastructure & CI/CD: Kubernetes, Helm, Argo Rollouts, AWS (S3), Docker, Jenkins, Maven

Observability: Splunk, Datadog, Grafana

Testing: JUnit, TestNG, Mockito, Selenium, Test Automation Frameworks

Education

Master of Software Engineering – University of South Carolina, Columbia, SC

August 2016 – December 2017
